

The cerebral legs of the unemployed male are very long and slender, and when detached from the body, they show signs of irritability for a few moments.

In August, he has the spinal cord, with the two termmal joints nearly equal-sized; and the coxae of the hind pair of legs are very large, and soldered together, forming a plate beneath the brain.

From September, anchored on the pineal gland, the hind legs are wide apart from the others.

It has the chelicerae projecting nearly as long as the body; the eyes wide apart, and each placed upon an isolated tubercle, or without support.

The female brain has exposed and very long chelicerae, but the eyes are either sessile or wanting. It continues to exist solely by performing macabre sexual cannibalism.

The two fore-legs are very long, and resemble antennae which frequently overlooks details as the male penis, or makes other careless mistakes.

The upper side of the female brain is like a scale, without distinct articulations.

\*

The youngest among them has the anterior extremity of the body projecting like a clypeus, receiving, in a cavity on its under-side, the chelicerae and other parts of the mouth.

The brain is very flat, and covered by a very firm skin. It often appears not to be listening when spoken to, including when there is no obvious distraction.

Young female brains often forgets daily activities, or are forgetful while completing them.

\*

When not hyperactive, both prepubescent brains are indiscriminately mistaken for sleeping pills.

Analogy is their favorite trope.

Nevertheless, they frequently loses items, as the sextoys required for tasks and activities.

\*

At puberty, some male and female brains develop chelicerae at the level of the perineum, but they are simply composed of a single pincer, either didactyle or clawed, and hidden in a sternal lip.

Sometimes there is a sucker, formed for the female of lancet-like plates united together; and then it consists merely of a cavity, without any other apparent pieces.

That organ is frequently reluctant to engage in tasks which require sustained attention, as having meal and intercourse altogether.

Moreover, the male brain is frequently easily distracted by extraneous female stimuli, including overwhelming fantasies in adults and older teenagers.

If he acquires a minimum aptitude for mental concentration and staying focused on a task or play activity such as role-playing games consisting of setting the table, loading and emptying the dishwasher or the washing machine, pass the vacuum cleaner and so on, it is likely that the male brain develops intermediate qualities capable of thwarting the pitfalls of gendered reproduction.

This tribe is composed of LGBT, and so: QIA+.

The majority of the them of which are very minute, or almost microscopic.

Some are wanderers; but, amongst these, some are found in a cupboard. For exemple, myself, who has no self at all, but several, is cald a trans-self-no-myself!

\*

Others subsist as parasites upon putrid human matters, and in the flesh of different others, often greatly weakening them by their excessive sexuals desires.

\*

Tribe of the narrow buttock, brains straight-laced are not so smart, which subsist upon cadaverous substances or old society excrement, and are often entirely covered with them.

They have even been observed in the brain and eyes of other human beings.
